Department of Fine Arts – Research Unit of the Department of Fine Arts

The democratization of student participation, the diversity of education means and the vocation of the collective construction of knowledge are constant topics in current education. In this horizon of expectations, basics of self-directed learning are outlined with educational interaction and technology infrastructure, proposed to create the conditions for a coherent and progressive construction of professional, cultural and constant learning competences.

This research works on the issue of connectivity implementation and operation and interactivity as axes of university education virtual mode, through the design of communication and learning strategies and integration of resources (multimedia and interactive materials, hypertexts, supports different environments, social networks, tutorials, interactive games, etc.) in the dynamics of courses.

Virtual resources education which has demonstrated the capacity and management of a teaching - learning process focused on the joint development of “know, know how, and know how to be” (significant learning), provides more than a connective and interactive construction, ease of establishing ties with the current communication dynamics, specifically with the dynamics of web, participating in inclusion and autonomy processes.
