

Automatic system for annoying sound source localization

Researchers: Dr. Jorge Moreno Ruiz and Ing. Mg. Richard Rivera Campos
Research assistant: Frank Vásquez

Department of Sciences - Physics Section - Acoustics

This system is able to accurately locate the strong loudness sound source above a threshold defined sound.

It uses a 4-microphone array, a camera and a data acquisition and processing system based on a compatible computer. Results will then be transmitted in real time to a mobile station issuing a document to be used to identify and punish drivers that make noise in the streets of the city.
